C. Eur. Gefluegelkonf., [Vortr.], 6th (1980), Volume 3, 407-14 Publisher: World's Poult. Sci. Assoc., Celle, Fed. Rep. Ger. SO CODEN: 45UTA8 AB Alfalfa leaf protein conc. (48% protein) was used in broiler feeds at different levels (0, 2.5, 5, 10 ro 15%). Its influence on growth, blood xanthophyll content and on the skin pigmentation was compared to that of a corn gluten (7.5 or 15%) and soybean meal feed (with or without apocarotene ester and canthaxanthin [514-78-3] supplements). A low level of alfalfa leaf protein conc. (2.5 or 5%) provided good growth results. The live wt. gain and feed conversion ratio from age 27 to 49 days were similar to those of controls. High alfalfa leaf protein conc. levels (10 and 15%) were detrimental. Blood xanthophyll content increased with food intake. It was the highest with apocarotene ester followed by gluten xanthophylls, then by the alfalfa xanthophylls. The carcass pigmentation
